Contents

- Part 1. 수집 - from ISLR package
 - Part 2. 전처리 - dplyr
 - Part 3. 분석 & 시각화 - ggplot2
 - Part 4. 문서화 - rmarkdown
-
- 간단한 프로젝트를 진행하면서 R의 기능과 관련 문법을 알아봅니다.
 - ISLR은 Introduction to Statistical Learning in R이라는 책에 포함된 함수와 데이터를 포함한 패키지입니다.
 - dplyr은 R에서 데이터 사이언스의 근간이 되는 `data.frame`을 효율적으로 다루는 패키지입니다.
 - rmarkdown은 R의 결과물을 포함한 문서를 만들어 내는 패키지입니다.

Part 1. 수집 - from "ISLR" package

패키지 (package, 응용프로그램, library)

- R을 처음에 설치하면 `base`라는 패키지가 인스톨 되어있음.
- `base`외의 확장 기능을 제공하는 패키지를 설치하여 사용하게 됨.
- R은 오픈 소스 기반 언어로써, 누구나 패키지를 만들고 R프로그램의 발전에 기여할 수 있음.
- R과 Python과 같은 오픈소스 언어에서는 많은 사람들이 많은 패키지를 만들고 많은 사람들이 사용하면서 발전이 일어남.
- 본 수업에서는 R에서 데이터 사이언스의 과정을 support하는 강력한 패키지 위주로 진행.
- 각각의 패키지는 특정 데이터나 함수를 제공함.

- base외의 패키지를 사용하려면 먼저 설치를 해주어야 함.
- 따옴표를 넣어서 문자열로 입력

```
install.packages("packageName")
```

- 설치이후에는 패키지 사용 전에 아래와 같이 패키지 사용을 선언해주어야 함.
- 따옴표 없이 입력

```
library(packageName)
```

파일 (files)

1. 소스 파일

- 명령어와 주석을 기록해둔 파일
- 한번에 실행이 가능한 단위로 구성
- 저장/불러오기/편집 등이 가능함 (Rstudio에서 마치 오피스 처럼 다룰 수 있음)
- `.r` : R 소스 파일
- `.Rmd` : R Markdown 소스파일
- 서식(폰트의 종류나 크기)이 없는 파일이기 때문에 메모장과 같은 텍스트 에디터에서도 저장/불러오기/편집이 가능함.

2. 데이터 파일

- 데이터가 기록된 파일
- .csv: 콤마로 구분된 파일 (Comma Separated Values)
- .txt: 더 일반적인 텍스트 파일. \t(Tab)이나 \n(줄바꿈) 등의 기호로 구분되어 있음
- .xls, .xlsx: 엑셀파일. 서식 등이 포함되어 있는 경우에는 [다른 이름으로 저장 - csv로 저장]하여 csv 파일로 저장하면 용량이 줄어들어서 다루기 좋은 경우가 많음. 엑셀 파일을 바로 불러오는 것도 특정 패키지를 이용하면 가능하고 점점 발전하고 있음.

3. R 데이터 파일

- R에서 작업중인 데이터를 저장하고 불러오는 데 유용한 파일.
- .Rdata: R 작업시에 현재 메모리의 상태를 저장하고 나중에 불러올 수 있어서 작업을 이어서 하는데 유용
- .Rda: Data Structure 객체 (object) 1개를 저장하는 파일

데이터 파일 불러오기/저장하기

0. 파일을 불러오면 R에서는 기본적으로 `data.frame`으로 받아들임

1. csv파일

- 데이터 프레임을 생성하는 명령이기에 `stringsAsFactors = FALSE`의 옵션의 사용을 추천!
- 만약에 데이터 파일의 첫 번째 line이 제목인 경우 이를 column name으로 만들 수 있음.
(이게 default임, 즉 `header=TRUE`를 입력하지 않더라도 `header=TRUE`로 동작함)

```
dataset <- read.csv("fileName.csv", header = TRUE, stringsAsFactors = FALSE)
```

- 만약에 첫 번째 line이 제목이 아니라면 `header=FALSE`를 사용해야 겠죠?

```
dataset <- read.csv("fileName.csv", header = FALSE, stringsAsFactors = FALSE)
```

- `data.frame`을 파일로 저장할 때에는 아래의 명령으로…

```
write.csv(dataset, "fileName.csv", header=TRUE)  
write.csv(dataset, "fileName.csv", header=FALSE)
```

2. txt파일

- csv파일과 매우 유사함. csv파일은 comma로 나누어져 있기에 별도의 입력이 필요하지 않지만, txt파일에서는 무엇으로 나누어져있는가를 입력해주어야 함. 이를 separator(sep)라고 함.
- `read.csv → read.table("fileName.txt", header = FALSE, sep = "\t", stringsAsFactors = FALSE)`
- `write.csv → write.table(dataset, "fileName.txt")`

3. xls, xlsx파일

```
library(readxl)
dataset <- read_excel("fileName.xlsx")
dataset <- read_excel("fileName.xlsx", col_names = FALSE)
# (same as `header=FALSE`)
```

4. R 데이터 파일

- 데이터셋 한개

```
save(dataset, "fileName.rda")
load("fileName.rda")
```

- 현재 메모리의 모든 객체 (변수와 함수)

```
save("fileName.Rdata")
load("fileName.Rdata")
```

경로 (디렉토리, directory)

- Rstudio를 어떻게 실행시켰냐에 따라서 현재 작업 디렉토리가 설정됨.
- Rstudio 아이콘을 더블클릭하여 실행하였을 때에는 시스템의 기본 설정대로 현재 작업 디렉토리가 됨.
- 이미 존재하는 .R이나 .Rmd 파일을 더블클릭하여 Rstudio를 실행했을 때에는 해당 파일의 경로가 현재 작업 디렉토리가 됨.
- 현재 작업 디렉토리를 확인하려면 `getwd()`를 실행.
- 작업 디렉토리를 바꾸려면 `setwd("C:/LS-DS")`을 실행.
- 디렉토리의 입력은 “C:/LS-DS”, “C://LS-DS”, “C:\\LS-DS”의 방식이 가능함.

Working Directory

`getwd()`

Find the current working directory (where inputs are found and outputs are sent).

`setwd('C://file/path')`

Change the current working directory.

Use projects In RStudio to set the working directory to the folder you are working in.

- 작업 디렉토리

- 현재 작업 디렉토리를 조회
(파일 저장시 여기에 저장됨)

- 작업 디렉토리를 설정

- Rstudio에서는 프로젝트 단위로의 설정도 제공
(진행하는 작업이 많아지면 유용함)

도시별 카시트 세일즈 데이터 불러오기 (ISLR 패키지)

Part 2. 전처리 - "dplyr"

dplyr?

1. 빠르고 직관적인 데이터를 다루는 패키지

- 가장 빠른 언어인 C를 기반으로 만들어서 빠름
- 데이터 처리에 있어서 가장 직관적인 SQL (Standard Query Language)과 유사하게 만들어져서 직관적임!
- 직관적이어서 코드 가독성도 높음
- 그러나 base 명령어도 같이 알아 두면 타인의 코드 참조와 파이썬, SQL등 다른 언어를 배울 때 도움이 됨

2. Hadley Wickham

- Head Scientist, Rstudio
- youtube.com에 keynote등 좋은 동영상 많아요!
- 통계학 박사 후 R에서 다수의 사용하기 좋은 패키지 개발
- 누나도 통계학 전공 교수
- ggplot2, dplyr, reshape2, stringr 등의 본인이 작성한 패키지를 묶어서 tidyverse라는 패키지를 제작

Basic Manipulation

- tidy data.frame!
 1. 개체 타입은 `data.frame`
 2. 각각의 row는 관찰값을 의미
 3. 각각의 column은 변수를 의미
- Basic Manipulation
 1. `rename`: 변수 이름 바꾸기. column의 이름을 바꿈
 2. `filter`: 관찰값 추출. row를 선택함
 3. `select`: 변수 추출. column을 선택함
 4. `arrange`: 관찰값 정렬. row를 재정렬함
 5. `mutate`: 변수 생성. column을 만듬

1. rename (이름 바꾸기)

```
Carseats <- rename(Carseats, Sales = Revenue)  
names(Carseats)[names(Carseats) == "Sales"] <- "Revenue"
```

d v
b

2. filter (관찰값 추출, Row 추출)

```
temp <- filter(Carseats, Income > 100)  
temp <- Carseats %>% filter(Income > 100)  
temp <- Carseats[Carseats$Income > 100, ]
```

d a > "pipe"
b

```
temp <- filter(Carseats, Age >= 30 & Age < 40)  
temp <- Carseats %>% filter(Age >= 30 & Age < 40) v d  
temp <- Carseats[((Carseats$Age >= 30) & (Carseats$Age < 40)), ] b
```

- & 는 “and”
- | 는 “or”

3. select (변수 추출, Column 선택)

```
temp <- select(Carseats, Income, Population)
temp <- Carseats %>% select(Income, Population)
temp <- Carseats[,c("Income", "Population")]
```

d
d
b

4. arrange (정렬)

```
Carseats <- arrange(Carseats, Price) v d 92%+5
Carseats <- Carseats %>% arrange(Price) v d
Carseats <- Carseats[order(Carseats$Price), ] b
```

```
Carseats <- arrange(Carseats, desc(Price)) d
Carseats <- Carseats %>% arrange(desc(Price)) d
Carseats <- Carseats[order(Carseats$Price, decreasing = TRUE), ] b
```

5. mutate (새로운 변수)

```
Carseats$Revenue <- Carseats$Sales  
Carseats <- mutate(Carseats,  
                      AdvPerCapita = Advertising/Population,      d  
                      RevPerCapita = Revenue/Population)  
Carseats <- Carseats %>%  
          mutate(AdvPerCapita = Advertising/Population,  
                      RevPerCapita = Revenue/Population)           d  
Carseats$AdvPerCapita <- Carseats$Advertising/Carseats$Population      b  
Carseats$RevPerCapita <- Carseats$Revenue/Carseats$Population            b  
  
Carseats <- mutate(Carseats, AgeClass = ifelse(Age>=60, "Silver", "non-Silver"))  
Carseats <- Carseats %>% mutate(AgeClass = ifelse(Age>=60, "Silver", "non-Silver"))  
Carseats$AgeClass <- ifelse(Carseats$Age >= 60, "Silver", "non-Silver")
```

Carseats

- 해당 Carseat 회사의 주요 구매층은 아이를 낳아서 키울 나이인 30대 연령층입니다.
- 소득이 높으면서 도시의 평균 연령이 30대인 도시에 충분한 광고비를 지출하고 있는지 검토해보고 싶습니다.
- Learning how to program makes your brain more logical.

```

# successive treatments
focusCity <- Carseats %>%
  filter(Income > 100) %>%
  filter(Age >= 30 & Age < 40) %>%
  mutate(AdvPerCapita = Advertising/Population) %>%
  select(Sales, Income, Age, Population, Education, AdvPerCapita) %>%
  arrange(Sales)
print(focusCity)

```

	Sales	Income	Age	Population	Education	AdvPerCapita
## 1	5.04	114	34	298	16	0.00000000
## 2	5.32	116	39	170	16	0.00000000
## 3	6.80	117	38	337	10	0.01483680
## 4	7.49	119	35	178	13	0.03370787
## 5	7.67	117	36	400	10	0.02000000
## 6	8.55	111	36	480	16	0.04791667
## 7	8.97	107	33	144	13	0.00000000
## 8	9.03	102	35	123	16	0.10569106
## 9	9.39	118	32	445	15	0.03146067
## 10	9.58	104	37	353	17	0.06515581
## 11	10.36	105	34	428	12	0.04205607
## 12	10.59	120	30	262	10	0.05725191
## 13	12.57	108	33	203	14	0.08374384

- 도시의 평균 나이가 20대, 30대, 40대 이상인 경우에 Revenue에 차이가 있을까요?

```
Carseats %>%
  mutate(AgeClass =
    ifelse(Age < 30, "Twenties",
           ifelse(Age < 40, "Thirties", "FourtyAbove")))) %>%
  group_by(AgeClass) %>%
  summarise(avgRevenue = mean(Sales))

## # A tibble: 3 x 2
##   AgeClass     avgRevenue
##   <chr>          <dbl>
## 1 FourtyAbove    7.30
## 2 Thirties       8.26
## 3 Twenties       7.76
```

Discussion

- 많은 데이터 분석은 “연속 변수”를 “이산 변수”로 변환하여, “이산 변수”의 group별 차이를 파악하는 접근을 사용합니다.
 - Later...
1. Age를 factor로 잡아 Sales의 Boxplot.
 2. Age를 factor로 잡아 scatterplot for Population & Sales.
 3. 변수 3개를 사용하는 습관
 4. 공간과 시간에 대한 동질성과 이질성을 생각하는 습관

Discussion

- 평균 나이에 따른 평균 Revenue의 차이는 무엇을 말해주나요?
- 평균 나이가 포함하지 못하고 있는 정보는 어떤 것이 있나요?
- 어떤 데이터가 있으면 더 좋을까요?
- 그 데이터가 있으면 어떻게 하실 건가요?

Discussion

dplyr	base
<i>Everyday Language</i>	<i>Classic Programming language</i>
사용성	타 언어와 범용적
SQL	<i>Pandas package in Python</i>

- SQL (Standard Query Language)
- 1. 대용량 데이터베이스와 통신하는 언어
- 2. R에서도 sqldf라는 패키지를 사용해서 SQL명령어로 작업할 수 있음.
- 3. R을 할 줄 아는 사람이 SQL을 배우는데 걸리는 시간 < 1 day
(얇은 책 하나만 사서 보시면 됩니다.)
- 4. 데이터를 보는 눈을 키워 줍니다.
- 데이터를 전처리하는 작업의 소요시간은 전체 프로젝트에서 80% 이상입니다.

cheatsheet for dplyr (1)

Data Transformation with dplyr :: CHEAT SHEET

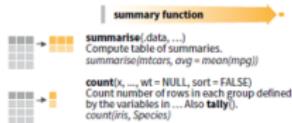

dplyr functions work with pipes and expect tidy data. In tidy data:

Summarise Cases

These apply **summary functions** to columns to create a new table of summary statistics. Summary functions take vectors as input and return one value (see back).

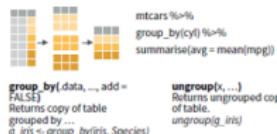

VARIATIONS

- summarise_all() - Apply funs to every column.
- summarise_at() - Apply funs to specific columns.
- summarise_if() - Apply funs to all cols of one type.

Group Cases

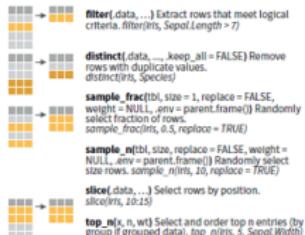

Use `group_by()` to create a "grouped" copy of a table. dplyr functions will manipulate each "group" separately and then combine the results.

Manipulate Cases

EXTRACT CASES

Row functions return a subset of rows as a new table.

Logical and boolean operators to use with filter()

< <= is.na() %in% | xor()
 > >= is.na() ! &

See `?base::logic` and `?Comparison` for help.

ARRANGE CASES

`arrange(data, ...)` Order rows by values of a column or columns (low to high), use with `desc()` to order from high to low.
arrange(mtcars, mpg)
arrange(mtcars, desc(mpg))

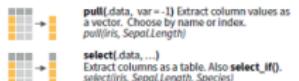

ADD CASES

`add_row(data, ..., before = NULL, after = NULL)`
Add one or more rows to a table.
`add_if(is, f, eruptions = 1, waiting = 1)`

Manipulate Variables

EXTRACT VARIABLES

Column functions return a set of columns as a new vector or table.

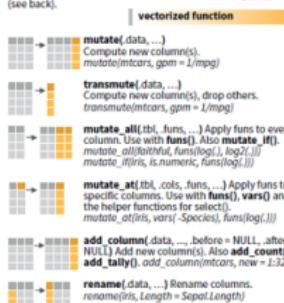

use these helpers with `select(...)`,
e.g. `select_if(is, starts_with("Sepal"))`

`contains(match)` `num_range(prefix, range)` ;, e.g. `mpg:cyl`
`ends_with(match)` `one_of(...)` -, e.g. `-Species`
`matches(match)` `starts_with(match)`

MAKE NEW VARIABLES

These apply **vectorized functions** to columns. Vectorized funs take vectors as input and return vectors of the same length as output (see back).

RStudio® is a trademark of RStudio, Inc. • CC BY SA RStudio • info@rstudio.com • 844-440-2121 • rstudio.com • Learn more with [browntroutnettes/package-c\("dplyr", "tidyverse"\)](#) • dplyr 0.7.0 • RStudio 1.2.0 • Updated: 2017-03

Cheatsheet for dplyr (2)

Vector Functions

TO USE WITH MUTATE ()

mutate() and **transmute()** apply vectorized functions to columns to create new columns. Vectorized functions take vectors as input and return vectors of the same length as output.

vectorized function

OFFSETS

dplyr::lag() - Offset elements by 1
dplyr::lead() - Offset elements by -1

CUMULATIVE AGGREGATES

dplyr::cumall() - Cumulative all()
dplyr::cumany() - Cumulative any()
dplyr::cummax() - Cumulative max()
dplyr::cummean() - Cumulative mean()
dplyr::cummin() - Cumulative min()
dplyr::cumprod() - Cumulative prod()
dplyr::cumsum() - Cumulative sum()

RANKINGS

dplyr::cume_dist() - Proportion of all values <=
dplyr::dense_rank() - rank with ties = min, no gaps
dplyr::rank() - rank with ties = min
dplyr::dense_rank() - rank with ties = min
dplyr::ranked() - rank into n bins
dplyr::percent_rank() - min rank scaled to [0,1]
dplyr::row_number() - rank with ties = "first"

MATH

* - * / ^ / ^ %/% %% - arithmetic ops
log(), log2(), log10(), log() --> logical comparisons
<->, >->, ><->, == - logical comparisons
dplyr::between() - test if x is between right
dplyr::near() - safe == for floating point numbers

MISC

dplyr::case_when() - multi-case if_ else()
dplyr::coalesce() - first non-NA values by element across a set of vectors
dplyr::if_(else()) - element-wise if() + else()
dplyr::na_if() - replace specific values with NA
pmax() - element-wise max()
pmin() - element-wise min()
dplyr::model() - Vectorized switch()
dplyr::recode_factor() - Vectorized switch() for factors

Summary Functions

TO USE WITH SUMMARISE ()

summarise() applies summary functions to columns to create a new table. Summary functions take vectors as input and return single values as output.

summary function

COUNTS

dplyr::n() - number of values/rows
dplyr::n_distinct() - # of uniques
sum(is.na()) - # of non-NA's

LOCATION

mean() - mean, also mean(is.na())
median() - median

LOGICALS

mean() - proportion of TRUE's
sum() - # of TRUE's

POSITION/ORDER

dplyr::first() - first value
dplyr::last() - last value
dplyr::nth() - value in nth location of vector

RANK

quantile() - nth quantile
min() - minimum value
max() - maximum value

SPREAD

IQR() - Inter-Quartile Range
mad() - median absolute deviation
sd() - standard deviation
var() - variance

Row Names

Tidy data does not use rownames, which store a variable outside of the columns. To work with the rownames, first move them into a column.

rownames_to_column() - Move row names into col.
a <- rownames_to_column(mtcars, vor = "C")

column_to_rownames() - Move col in row names.
column_to_rownames(a, vor = "C")

Also has `_rownames()`, `remove_rownames()`

Combine Tables

COMBINE VARIABLES

x y

Use bind_cols() to paste tables beside each other as they are.

bind_cols(..., .) - Returns tables placed side by side as a single table.
BE SURE THAT ROWS ARE THE SAME!

Use a "Mutating Join" to join one table to another. It has two matching columns with the rows that correspond to. Each join retains a different combination of values from the tables.

left_join(x, y, by = NULL, copy = FALSE, suffix = c("x", "y"), ...) - Join matching values from y to x.

right_join(x, y, by = NULL, copy = FALSE, suffix = c("x", "y"), ...) - Join matching values from x to y.

inner_join(x, y, by = NULL, copy = FALSE, suffix = c("x", "y"), ...) - Join data. Retain only rows with matches.

full_join(x, y, by = NULL, copy = FALSE, suffix = c("x", "y"), ...) - Join data. Retain all values, all rows.

Use `by = c("col1", "col2")` to specify the columns to match on.
left_join(x, y, by = "A")

Use a named vector, `by = c("col1" = "col2")`, to match on columns with different names in each data set.
left_join(x, y, by = c("C" = "D"))

Use suffix to specify suffix to give to duplicate column names.
left_join(x, y, by = c("C" = "D"), suffix = c("1", "2"))

Use a "Filtering Join" to filter one table against the rows of another.

semi_join(x, y, by = NULL, ...) - Return rows of x that have a match in y.
USEFUL TO SEE WHAT WILL BE JOINED.

anti_join(x, y, by = NULL, ...) - Return rows of x that do not have a match in y.
USEFUL TO SEE WHAT WILL NOT BE JOINED.

Part 3. 분석 & 시각화 - 'ggplot2'

"The simple graph has brought more information to the data analyst's mind than any other device."

(간단한 그래프는 다른 어떤 장치보다 데이터 분석가의 마음에 더 많은 정보를 제공합니다.)

- John Tukey

mpg

- ggplot2 패키지에 내장된 데이터셋
- 1999년 부터 2008년 까지의 38개 차종 연비 데이터
- 데이터셋 diamond와 함께 ggplot 관련 문서에서 가장 많이 예제로 쓰임.

변수 이름	변수 설명
<i>manufacturer</i>	
<i>model</i>	차종 <i>Model name</i>
<i>displ</i>	엔진 크기 <i>engine displacement, in litres</i>
<i>year</i>	연식 <i>year of manufacture</i>
<i>cyl</i>	기통 <i>number of cylinders</i>
<i>trans</i>	트랜스미션 <i>type of transmission</i>
<i>drv</i>	전륜/후륜/사륜 $f = \text{front-wheel drive}$, $r = \text{rear wheel drive}$, $4 = 4\text{wd}$
<i>cty</i>	도심마일리지 <i>city miles per gallon</i>
<i>hwy</i>	고속도로마일리지 <i>highway miles per gallon</i>
<i>fl</i>	연료 종류 <i>fuel type</i>
<i>class</i>	(세단, SUV...) "type" of car

```

class(mpg)

## [1] "tbl_df"     "tbl"        "data.frame"

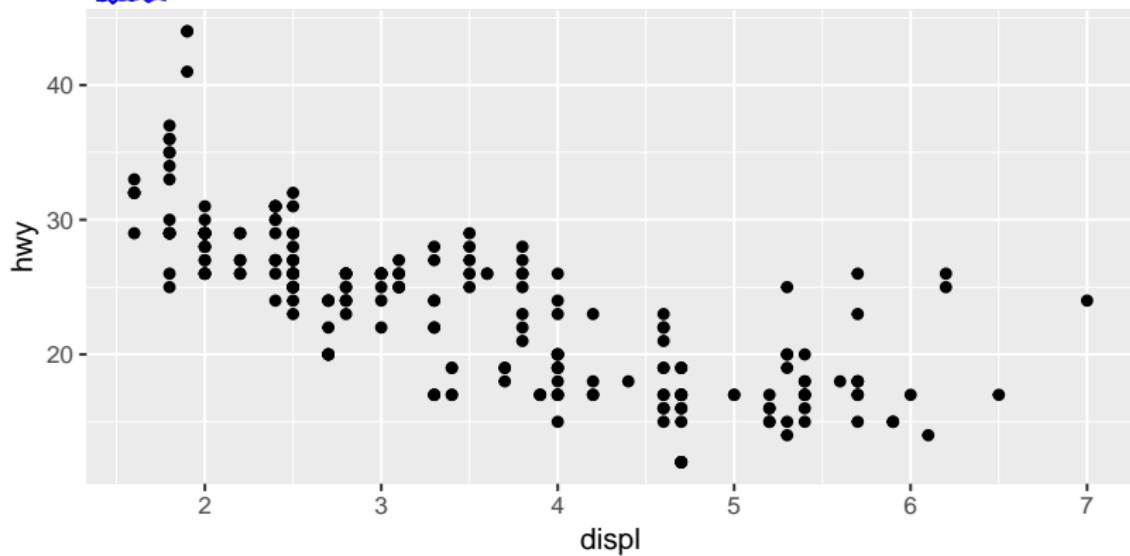

```

- mpg는 여러개의 class의 특징을 가지고 있습니다.
- tbl_df는 data.frame의 업그레이드 버전입니다. (몇 가지 기능 추가)

엔진이 크면 연비가 안 좋을까요?

- 엔진 크기를 x축, 고속도로 마일리지를 y축으로 하는 산점도 (scatterplot)을 그려봅시다.

```
ggplot(data = mpg) +  
  geom_point(mapping = aes(x = displ, y = hwy))
```

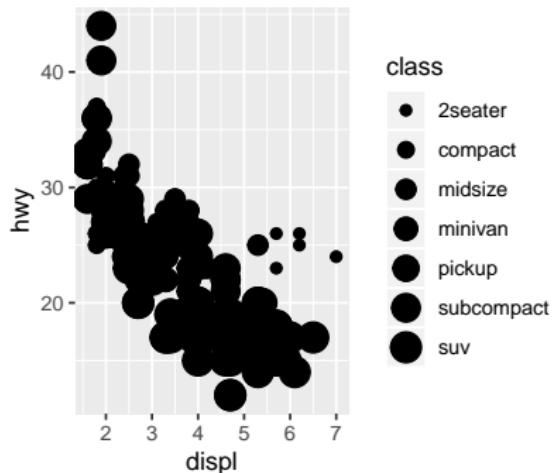

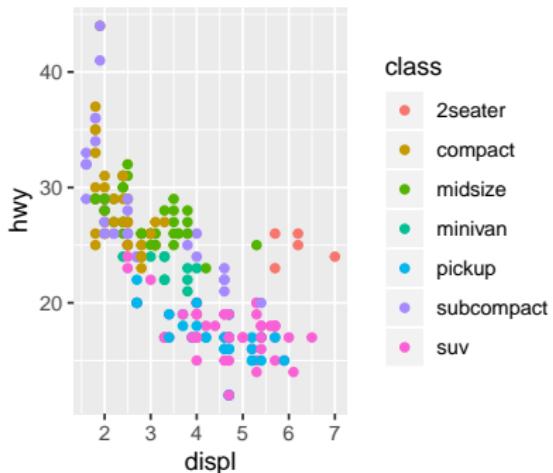

- 엔진이 크면 연비가 안 좋나요?
- 추가적으로 궁금한게 있나요?

```
# basic ggplot command  
ggplot(data = <DATA>) +  
<GEOM_FUNCTION>(mapping = aes(<MAPPING>))
```

```

suppressMessages(library(gridExtra)) # grid.arrange()
a <- ggplot(data = mpg) +
  geom_point(mapping = aes(x = displ, y = hwy, color = class))
b <- ggplot(data = mpg) +
  geom_point(mapping = aes(x = displ, y = hwy, size = class))
grid.arrange(a, b, nrow=1, ncol=2)

```

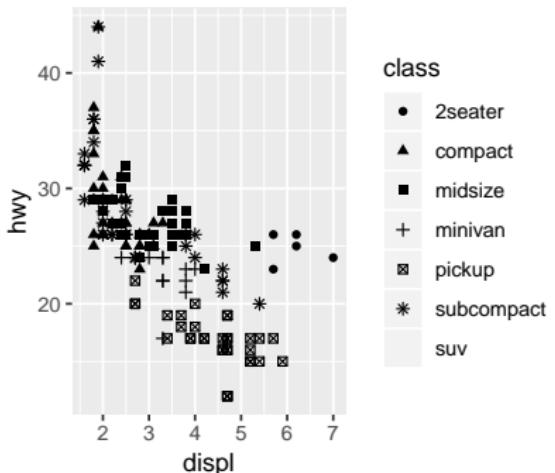

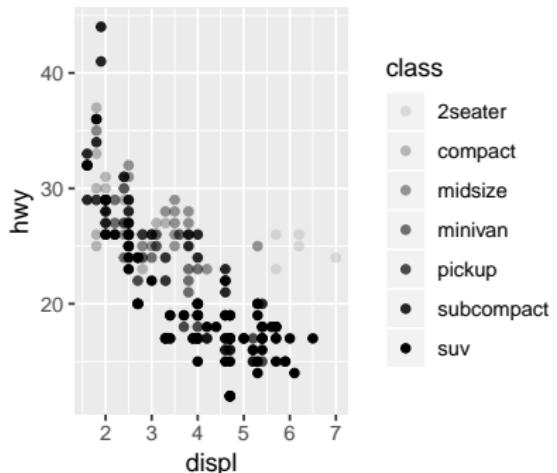

```

c <- ggplot(data = mpg) +
  geom_point(mapping = aes(x = displ, y = hwy, alpha = class))
d <- ggplot(data = mpg) +
  geom_point(mapping = aes(x = displ, y = hwy, shape = class))
grid.arrange(c, d, nrow=1, ncol=2)

## Warning: Using alpha for a discrete variable is not advised.
## Warning: The shape palette can deal with a maximum of 6 discrete values
## because more than 6 becomes difficult to discriminate; you have 7.
## Consider specifying shapes manually if you must have them.

```

- a, b, c, d 중에 어느 그림이 가장 효과적인가요?
- 일반화 시키실 수 있나요? 즉, size, alpha, color, shape의 사용 기준은?

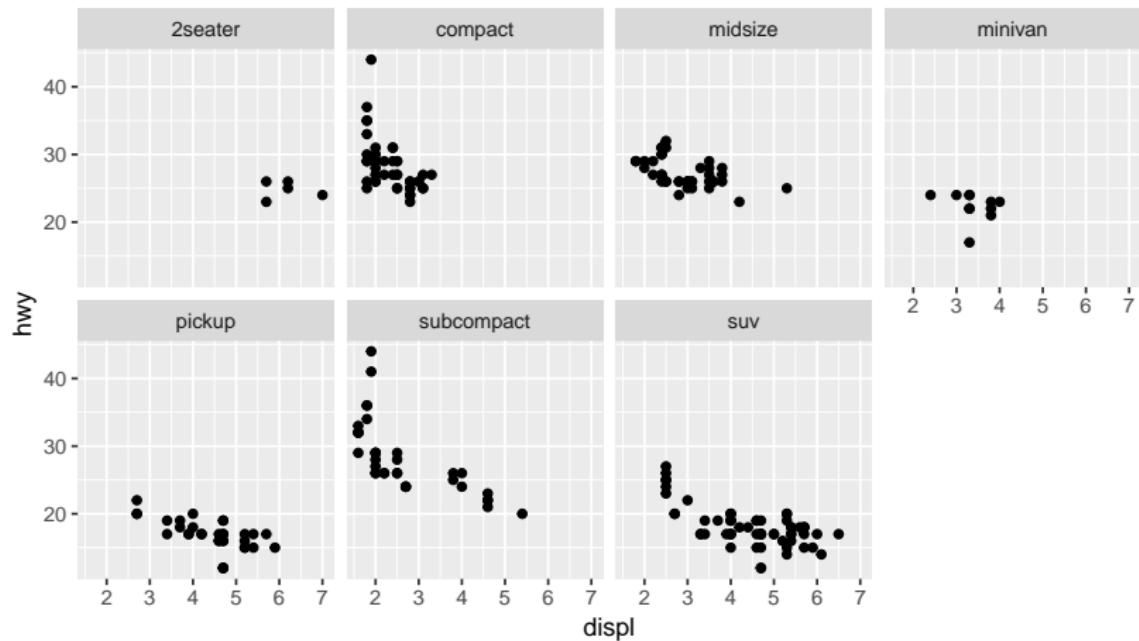

Aesthetics (aes) - size, alpha, color, shape

변수 타입	ggplot aes	연속성	특징
Numeric (quantitative, 정량적)	<code>size</code> <code>alpha</code>	continuous (연속) or discrete (이산)	더할 수 있음 크고 작음
Factor (qualitative, 정량적)	<code>color</code> (<10) <code>shape</code> (<7)	discrete (이산)	더할 수 없음 집합 연산

자주 쓰이는 ggplot의 추가 기능들

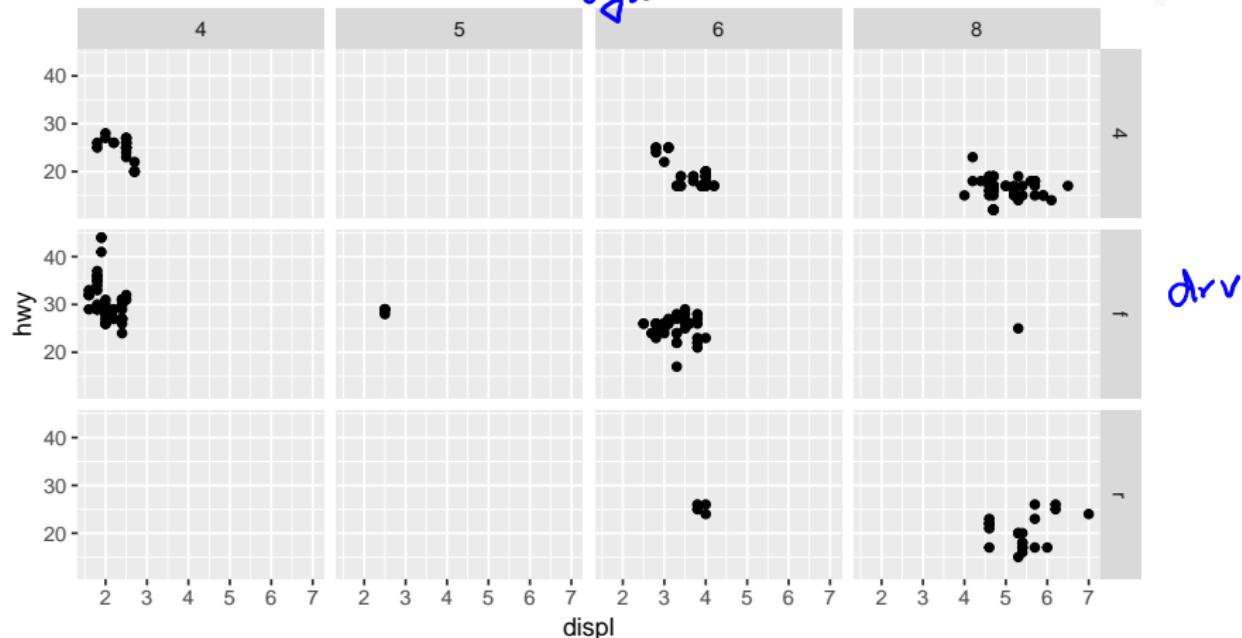

Facets (1 variable) - facet_wrap

```
ggplot(data = mpg) +  
  geom_point(mapping = aes(x = displ, y = hwy)) +  
  facet_wrap(~ class, nrow = 2)
```

Facets (2 variables) - facet_grid

```
ggplot(data = mpg) +  
  geom_point(mapping = aes(x = displ, y = hwy)) +  
  facet_grid(drv ~ cyl)
```

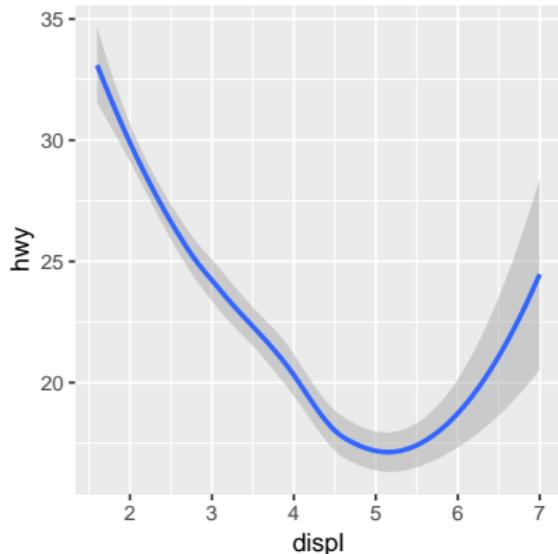

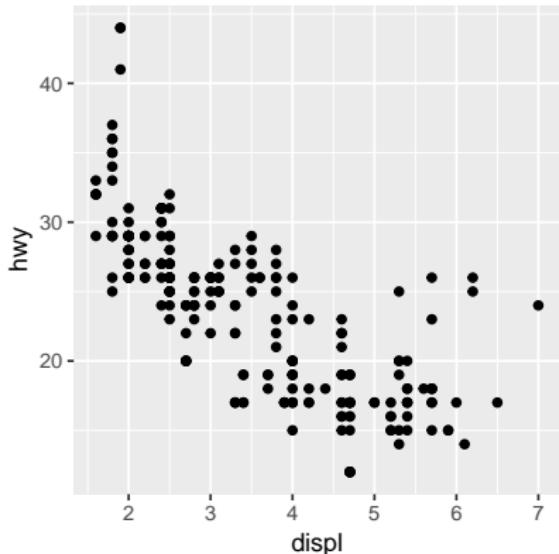

Discussion

- When or not to facet?
1. Data가 충분히 많을 때 -> do facet
 2. Distribution 자체를 보고 싶을 때 -> do facet
 3. 근접 비교를 하고 싶을 때 -> don't facet
 4. factor 변수의 갯수를 고려해야 함 -> **magic number**

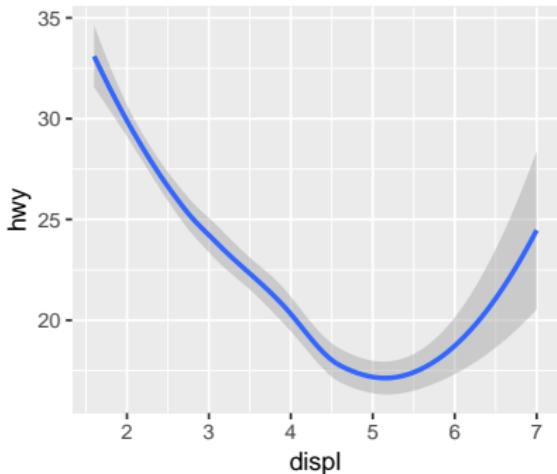

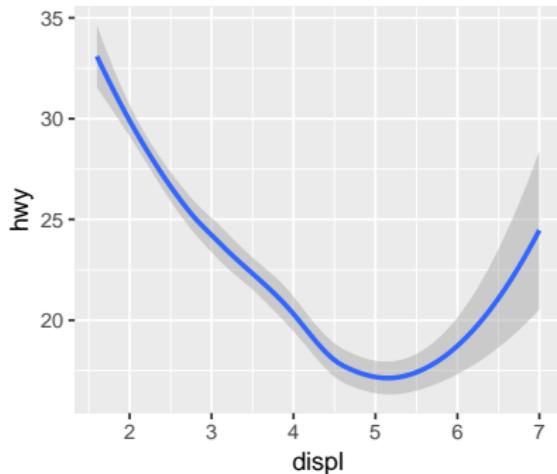

Point vs Smooth

```
e <- ggplot(data = mpg) +  
  geom_point(mapping = aes(x = displ, y = hwy))  
f <- ggplot(data = mpg) +  
  geom_smooth(mapping = aes(x = displ, y = hwy))  
grid.arrange(e, f, nrow = 1, ncol = 2)
```

AES mapping의 중첩

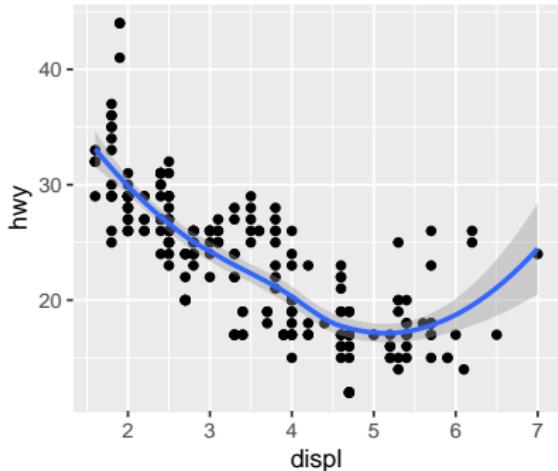

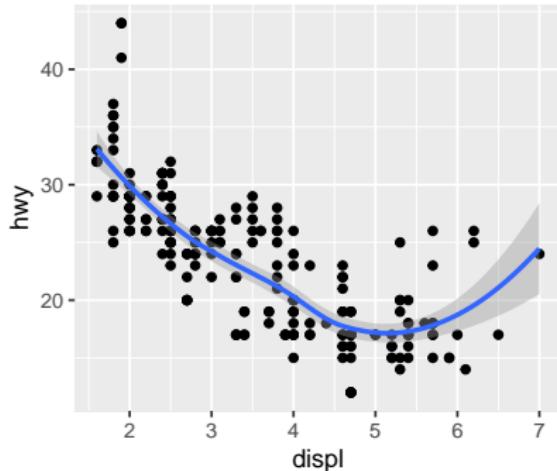

```
g <- ggplot(data = mpg) +
  geom_smooth(mapping = aes(x = displ, y = hwy))
h <- ggplot(data = mpg, mapping = aes(x = displ, y = hwy)) +
  geom_smooth()
grid.arrange(g, h, nrow = 1, ncol = 2)
## `geom_smooth()` using method = 'loess' and formula 'y ~ x'
```

Point + Smooth

```
i <- ggplot(data = mpg) +
  geom_point(mapping = aes(x = displ, y = hwy)) +
  geom_smooth(mapping = aes(x = displ, y = hwy))
j <- ggplot(data = mpg, mapping = aes(x = displ, y = hwy)) +
  geom_point() +
  geom_smooth()
grid.arrange(i, j, nrow = 1, ncol = 2)

## `geom_smooth()` using method = 'loess' and formula 'y ~ x'
```

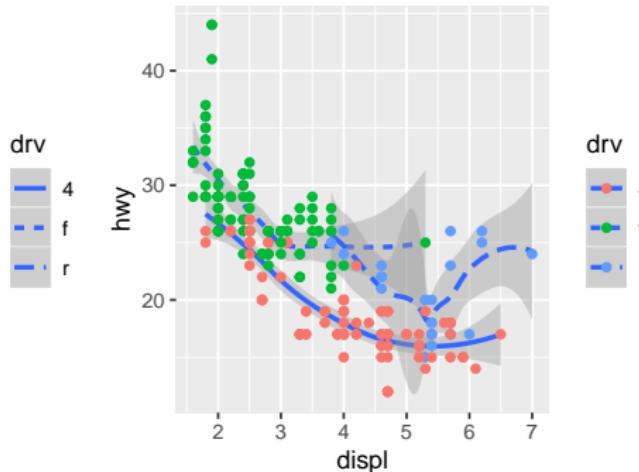

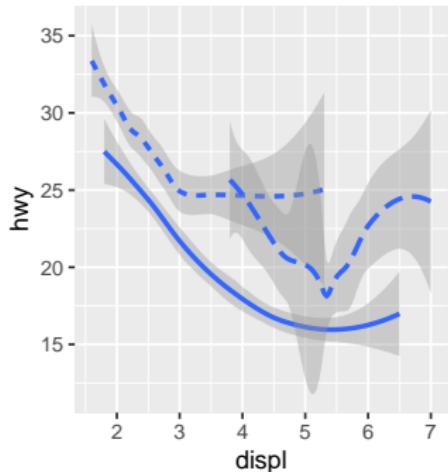

```

k <- ggplot(data = mpg, mapping = aes(x = displ, y = hwy)) +
  geom_smooth(aes(linetype = drv))
l <- ggplot(data = mpg, mapping = aes(x = displ, y = hwy)) +
  geom_smooth(aes(linetype = drv)) +
  geom_point(aes(color = drv))
grid.arrange(k, l, nrow = 1, ncol = 2)

## `geom_smooth()` using method = 'loess' and formula 'y ~ x'

```

Summary - ggplot

- Data, Aesthetic, Geometric Object를 명시하여 그림을 rendering.
- gridExtra 패키지의 grid.arrange 함수를 이용하여 grid 형태로 위치시킬 수 있음
- Size > Alpha > Color >= Shape 의 특성을 이해

```
ggplot(data = <DATA>) +  
<GEOM_FUNCTION>(mapping = aes(<MAPPING>))
```

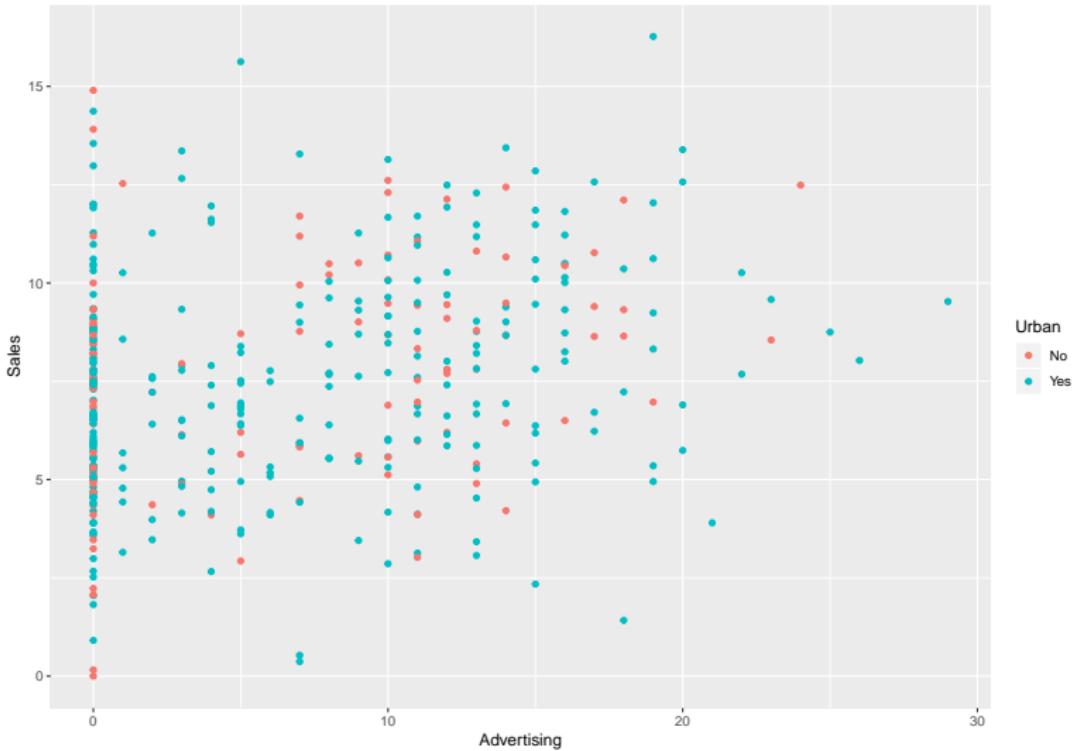

1. 그림의 목적을 정하고
2. X (explanatory variable - 설명 변수)의 개수와 각 변수의 중요도와 순서
3. Y (dependent variable)를 명시
4. ggplot 객체를 rendering

Carseat

```
str(Carseats)

Data Visualization with ggplot2 :: CHEAT SHEET

Basics

ggplot2 is based on the grammar of graphics, the idea that you can build every graph from the same components: a data set, a coordinate system, and geoms—visual marks that represent data points.

To display values, map variables in the data to visual properties of the geom (aesthetics) like size, color, and x and y locations.

Complete the template below to build a graph.

```
ggplot(data = DATA) +
  GEOGRAPHICAL_FUNCTIONS(mapping = aes(MAPPINGS),
  stat = STAT, position = POSITION) +
  COORDINATE_FUNCTIONS+
  FACET_FUNCTIONS+
  SCALE_FUNCTIONS+
  THEME_FUNCTIONS
```

ggplot(data = mpg, aes(x = cyl, y = hwy)) begins a plot that you finish by adding layers to. Add one geom function per layer.

```
+ aesthetic mappings + data + geom  
ggplot(x = cyl, y = hwy, data = mpg, geom = "point")  
Creates a complete plot with given data, geom, and mappings. Supplies many useful defaults.
```

last_plot() Returns the last plot.

```
ggplot("plot.png", width = 5, height = 5) Saves last plot as 5 x 5 and named "plot.png" in working directory.  
Matches file type to file extension.
```

Geoms

Use a geom function to represent data points, use the geom's aesthetic properties to represent variables. Each function returns a layer.

GRAPHICAL PRIMITIVES

```
a <- ggplot(economics, aes(date, unemploy))  
b <- ggplot(balls, aes(x = long, y = lat))
```

a + geom_<Mark> for expanding limits

```
b + geom_curve(arrows = tail = TRUE,  
xend = long, yend = lat)  
b + geom_rect(xmin = x, xmax = y, ymin = alpha,  
ymax = beta, angle, color, curvature, size)
```

```
b + geom_polygon(aes(group = group))  
x, y, alpha, color, fill, group, linetype, size
```

```
b + geom_rect(xmin = min, ymin = max,  
xmax = long, ymax = lat + radius, xmin = min, ymax = max,  
angle, color, fill, group, linetype, size)
```

```
b + geom_ribbons(xmin = min, unemploy = 900,  
xmax = unemploy + 900) -> x, ymax, ymin,  
alpha, color, fill, group, linetype, size
```

LINE SEGMENTS

common aesthetics: x, y, alpha, color, linetype, size
+ geom_abline(mapping = aes(intercept = 0), slope = 1)

```
+ geom_hline(mapping = aes(yintercept = 1))  
+ geom_segment(mapping = aes(xend = x, yend = y))  
+ geom_speaks(mapping = aes(angle = 115.5, radius = 1))
```

ONE VARIABLE continuous

```
c <- ggplot(mpg, aes(hwy)); c + ggplot(mpg)
```

```
+ geom_area(mapping = aes(hwy))  
+ geom_density(mapping = aes(gaussian))  
+ geom_dots(mapping = aes(dots))
```

```
+ geom_freqpoly(mapping = aes(hwy))  
+ geom_histogram(mapping = aes(hwy))
```

```
+ geom_qq(mapping = aes(hwy))  
+ geom_violin(mapping = aes(hwy))
```

```
+ geom_warm(mapping = aes(hwy))  
+ geom_xunit(mapping = aes(hwy))
```

```
d <- ggplot(mpg, aes(hwy))  
d + geom_bar()
```

```
x, alpha, color, fill, linetype, size, weight
```

TWO VARIABLES

continuous x, continuous y

```
e <- ggplot(balls, aes(x, y))
```

```
+ geom_point(mapping = aes(x = x, y = y))  
+ geom_rect(mapping = aes(x = x, y = y))
```

```
+ geom_point(mapping = aes(x = x, y = y))  
+ geom_rect(mapping = aes(x = x, y = y))
```

```
+ geom_point(mapping = aes(x = x, y = y))  
+ geom_rect(mapping = aes(x = x, y = y))
```

```
+ geom_rect(mapping = aes(x = x, y = y))  
+ geom_rect(mapping = aes(x = x, y = y))
```

```
+ geom_rect(mapping = aes(x = x, y = y))  
+ geom_rect(mapping = aes(x = x, y = y))
```

```
+ geom_rect(mapping = aes(x = x, y = y))  
+ geom_rect(mapping = aes(x = x, y = y))
```

```
+ geom_rect(mapping = aes(x = x, y = y))  
+ geom_rect(mapping = aes(x = x, y = y))
```

```
+ geom_rect(mapping = aes(x = x, y = y))  
+ geom_rect(mapping = aes(x = x, y = y))
```

```
+ geom_rect(mapping = aes(x = x, y = y))  
+ geom_rect(mapping = aes(x = x, y = y))
```

```
+ geom_rect(mapping = aes(x = x, y = y))  
+ geom_rect(mapping = aes(x = x, y = y))
```

```
+ geom_rect(mapping = aes(x = x, y = y))  
+ geom_rect(mapping = aes(x = x, y = y))
```

THREE VARIABLES

```
sealish <- mtcars[, c(1, 8, 9, 10)]  
sealish <- sealish %>% mutate(long2 = delta.lat * 2)
```

```
+ geom_contour(mapping = z ~ x)  
x, y, z, alpha, color, group, linetype, size, weight
```

```
+ geom_raster(mapping = z ~ x)  
x, y, z, alpha, fill, interpolate, FALSE, x, y, alpha, fill
```

```
+ geom_tile(mapping = z ~ x)  
x, y, alpha, color, fill, linetype, size, weight
```

continuous bivariate distribution

```
b <- ggplot(diamonds, aes(carat, price))
```

```
+ geom_bin2d(mapping = c(b <- binwidth = c(0.25, 500))
```

```
x, y, alpha, color, fill, linetype, size, weight
```

```
+ geom_hex(mapping = c(b <- binwidth = c(0.25, 500)))
```

```
x, y, alpha, color, fill, linetype, size
```

```
+ geom_hex(mapping = c(b <- binwidth = c(0.25, 500)))
```

```
x, y, alpha, color, fill, linetype, size
```

```
+ geom_hex(mapping = c(b <- binwidth = c(0.25, 500)))
```

```
x, y, alpha, color, fill, linetype, size
```

```
+ geom_hex(mapping = c(b <- binwidth = c(0.25, 500)))
```

```
x, y, alpha, color, fill, linetype, size
```

```
+ geom_hex(mapping = c(b <- binwidth = c(0.25, 500)))
```

```
x, y, alpha, color, fill, linetype, size
```

```
+ geom_hex(mapping = c(b <- binwidth = c(0.25, 500)))
```

```
x, y, alpha, color, fill, linetype, size
```

```
+ geom_hex(mapping = c(b <- binwidth = c(0.25, 500)))
```

```
x, y, alpha, color, fill, linetype, size
```

Stats

An alternative way to build a layer

A stat builds new variables to plot (e.g., count, prop).

Visualize a stat by changing the default stat of a geom function, `geom_bar(stat="count")` or by using a stat function, `stat_count(geom="bar")`, which calls a default function, `stat_summary(fun="count")`. You can also use `..name..` syntax to map stat variables to aesthetics.

```
c + stat_bin(binwidth=1, origin=10)
x + y | .count ..density.. ..density..
c + stat_count(count=1, n=100) ..count.. ..prop..
c + stat_density(density=1, kernel="gaussian")
x + y | ..count.. ..density.. ..scaled..
```

```
c + stat_ecdf(breaks=10, drop=TRUE)
x + y | ..count.. ..density.. ..density..
c + stat_hexbin(x=x, y=y, ..count.. ..density..
c + stat_hexbin(x=x, y=y, ..count.. ..density..
x + y, color, size) ..level.. ..level..
```

```
c + stat_ellipse(level=0.95, segments=51, type="T")
```

```
l + stat_contour(bins=2) x, y, z, order | ..level..
```

```
l + stat_summary(bins=2, z=1, bins=30, fun=max)
```

```
x, y, z, R | ..value.. ..value.. ..value.. ..value..
```

```
f + stat_bxpnotched(x=1.5) x, y, ..lower.. ..middle.. ..upper.. ..width.. ..ymin.. ..ymax..
```

```
f + stat_identitykernel(x="gaussian") ..density.. ..scaled.. ..count.. ..n.. ..widthmethod.. ..width..
```

```
e + stat_ecdf(n=40) x, y | ..x.. ..y..
```

```
e + stat_quantile(quintiles=c(0.1, 0.9), formula=y~x, alpha=0.95, color="red")
```

```
e + stat_smooth(method="lm", formula=y~x, se=T, level=0.95) x, y | ..se.. ..ymin.. ..ymax..
```

```
ggplot() + stat_function(aes(x=-3:3), n=99, fun=sin, args=list(d=0.5)) x, y | ..x.. ..y..
```

```
e + stat_identity(name="TRUE")
```

```
ggplot() + stat_qqplot(data=qnorm, dist="t", sample=qnorm, n=100) x, y | ..sample.. ..qqnorm.. ..dist.. ..n..
```

```
e + stat_summary(fun.data="mean_cl_boot")
```

```
b + stat_summary(fun.y="mean", geom="bar")
```

```
e + stat_unique()
```

Scales

Scales map data values to the visual values of an aesthetic. To change a mapping, add a new scale.

GENERAL PURPOSE SCALES

Use x/y with aesthetics

```
scale_x_continuous() - map cont_val: values to visual ones
scale_y_continuous() - map discrete values to visual ones
scale_x_discrete() - map categorical values to visual ones
scale_y_discrete() - map discrete values to visually chosen visual ones
scale_x_manual(values=c(x1, x2)) - map discrete values to manually chosen visual ones
scale_y_date() - labels are dates
scale_x_date() - treat x values as dates
scale_y_datetime() - treat x/y values as date times.
(the same arguments as scale_x_date). See ?strptime for label format.
```

X & Y LOCATION SCALES

Use x/y with aesthetics (x shown here)

```
scale_x_log10() - Plot x on log10 scale
scale_x_reverse() - reverse direction of x axis
scale_x_sqrt() - Put x on square root scale
```

COLOR AND FILL SCALES (DISCRETE)

```
n - d + geom_bar(aes(fill=f1))
n + scale_fill_brewer(palette="Blues")
f + scale_fill_brewer(display=brewer.all)
n + scale_fill_grey(start=0.2, end=0.8,
  na.value="red")
```

COLOR AND FILL SCALES (CONTINUOUS)

```
o + c + geom_dotplot(aes(fill=x))
o + scale_fill_distiller(palette="Blues")
o + scale_fill_gradient("red", "high"="yellow")
o + scale_fill_gradient2("low"="red", "high"="blue",
  mid="white", midpoint = 25)
o + scale_fill_gradients(colors=topo.colors[6])
Also: rainbow(), heat.colors(), terrain.colors(),
cm.colors(), RdGyBrewer::brewer.pal
```

SHAPE AND SIZE SCALES

```
p + e + geom_point(aes(shape=0, size=cyl))
p + scale_shape() + scale_size()
p + scale_size_area(max_size=8)
p + scale_size_area(max_size=8)
```

Coordinate Systems

coord_*_fixed() - fixed coordinates between 0 and 1
coord_polar() - polar coordinates
coord_rect() - rectangular coordinates with fixed aspect ratio
coord_trans() - transform coordinates with fixed aspect ratio
coord_flip() - flip coordinates
coord_treemap() - treemap coordinates
coord_quickmap() - quickmap coordinates
coord_mapprojection() - mapprojection coordinates
coord_map() - map projection, orientation, scale, etc.
coord_sf() - spatial coordinates. Set strata and regions
coord_sf() - spatial coordinates. Set strata and regions
coord_sf() - spatial coordinates. Set strata and regions

coord_sf() - set axis limits vary across facets

t + facet_grid(~ f1, scales="free")

t + facet_grid(~ f1, scales="free", facet_grid=facet_grid)

t + facet_grid(~ f1, scales="free", facet_grid=facet_grid)

Position Adjustments

Position adjustments determine how to arrange geoms that would otherwise occupy the same space.

```
s + ggplot(mpg, aes(f1, fill=drv))
# Average elements side by side
s + position_dodge() - "dodge"
s + geom_bar(position="dodge")
s + geom_bar(position="stack") - stack top of one another, normalize height
s + geom_bar(position="stack-top") - stack top of one another, position of each element to avoid overlapping
s + geom_label(position="dodge") - Dodge labels away from points
s + geom_label(position="stack") - Stack elements on top of one another
```

Each position adjustment can be recast as a function with manual width and height arguments

```
s + geom_bar(position=position_dodge(width=1))
```

Themes

```
t + theme_bw() - white background with grid lines
t + theme_gray() - light gray background
t + theme_minimal() - default theme
t + theme_light() - light gray background
t + theme_dark() - dark background
t + theme_void() - empty theme
```

Faceting

Facets divide a plot into subplots based on the values of one or more discrete variables.

```
t + ggplot(mpg, aes(cty, hwy)) + geom_point()
```

t + facet_grid(~ f1) - facet into columns based on f1

t + facet_grid(~ f1, direction=-1) - facet into rows based on f1

t + facet_grid(~ f1, direction=1) - facet into both rows and columns

t + facet_grid(~ f1, switch="both") - switch to a rectangular layout

Set scales to let axis limits vary across facets

t + facet_grid(~ f1, scales="free")

t + facet_grid(~ f1, scales="free", facet_grid=facet_grid)

t + facet_grid(~ f1, scales="free", facet_grid=facet_grid)

t + facet_grid(~ f1, scales="free", facet_grid=facet_grid)

Set labeler to adjust facet labels

t + facet_grid(~ f1, labeler=label_both)

t + facet_grid(~ f1, labeler=label_bquote(alpha ~ f1))

t + facet_grid(~ f1, labeler=label_parsed)

Labels

```
t + label(x="New x axis label", y="New y axis label")
t + title("New title above this plot")
t + subtitle("Add a subtitle below title")
t + caption("Add a caption below plot")
t + guide("New legend", legend=legend)
t + annotate(gem="text", x=8, y=9, label="K")
```

t + annotate(gem="text", x=8, y=9, label="K")

See [position](#) for manual values for geom's aesthetics

Legends

```
t + theme(legend.position="bottom")
t + theme(legend.position="bottom", top, left, or right)
t + guide(fill="none")
```

Set a guide for each aesthetic: colorbar, legend, or none (no legend)

```
t + scale_fill_discrete(name="Title",
  labels="New labels", legend=legend)
```

Set legend title and labels with a scale function.

Zooming

Without clipping (preferred)

t + coord_cartesian(xlim=c(0, 20), ylim=c(0, 20))

With clipping (removes unseen data points)

t + xlim(0, 100) + ylim(0, 20)

t + scale_x_continuous(limits=c(0, 100)) +

scale_y_continuous(limits=c(0, 100))

```

## R Markdown

This is an R Markdown presentation.
<http://rmarkdown.rstudio.com>.

When you click the **Knit** button a document will be generated that includes both content as well as the output of any embedded R code chunks within the document.

## Slide with Bullets

- Bullet 1
- Bullet 2
- Bullet 3

## Slide with R Output

```{r cars, echo = TRUE}
summary(cars)
```

```

beamer (/Ref-rmdTemplates/M82-beamer)

The screenshot shows the RStudio interface with the 'rmd-beamer-template.Rmd' file open. The code is a template for a beamer presentation, defining various parameters like title, author, date, and theme. It includes sections for 'Design' (headings, colors, themes), '2단 구성' (two-column layout), 'Left Column' (plots), 'Right Column' (code line numbers), and 'Code line number' (a preview of the R code). The preview window shows a two-column slide with a plot in the left column and code in the right column.

Example - 1주차 숙제

The screenshot shows the RStudio interface with two panes. The left pane displays the R code for a R Markdown document (a.Rmd). The right pane shows the rendered output of the document.

RStudio Left Pane (Code):

```
1 - ---
2 title: "Review - week1"
3 author: "learningspoonsR"
4 date: "2018년 4월 15일"
5 output: word_document
6 ---
7
8 ```{r setup, include=FALSE}
9 knitr::opts_chunk$set(echo = TRUE)
10 knitr::opts_chunk$set(results = 'hide')
11 ```
12
13 ## Module 1 - Hello world
14
15 `r problem <- 1`
16
17 **Problem** `r problem` . `r problem <- problem + 1`
18 ```{r}
19 a <- "Hello"
20 a
21 ```
22 ans:
23
24
25 **Problem** `r problem` . `r problem <- problem + 1`
26 ```{r}
27 a <- "Hello"
28 b <- "world"
29 paste(a,b)
30 ```
31 ans:
32
```

18:7 Chunk 2 R Markdown

RStudio Right Pane (Output):

Review - Week1
learningSpoonsR
2018년 4월 15일

• Module 1 - Hello World

Problem 1.
a <- "Hello";
a;
ans;
ans;

Problem 2.
a <- "Hello";
b <- "World";
paste(a,b);
ans;

Problem 3.
paste(a,b);
ans;

Problem 4.
paste(a,b,sep="");
ans;

```
**Problem** `r problem`.  
`r problem <- problem + 1`  
```{r}  
grep("ui", font)
```  
```{r, echo=FALSE}  
ans0 <- "ANS: The function grep somehow returns 0 or 1, which is
equivalent to TRUE or FALSE!"
ans0
```  
ans:
```

Problem 3.

```
grep("ui", font)  
## [1] 1  
## [1] "ANS: The function grep somehow returns 0 or 1, which is equivalent to  
TRUE or FALSE!"  
ans:
```

R Markdown :: CHEAT SHEET

What is R Markdown?

Readable File - An R Markdown (.Rmd) file is a record of your research. It contains the code that a researcher used to generate work along with the narration that a reader can reuse.

Reproducible Research - At the click of a button, or the type of a command, you can rerun the code in an R Markdown file to generate a report and export the results as a finished report.

Dynamic Documents - You can choose to export your R Markdown document in many formats, including HTML, pdf, MS Word, or RTF documents; html and pdf based slides; Notebooks, and more.

Workflow

- Open a new .Rmd file
- Run the code that opens to preview the document
- Write document by editing template
- Knit document to create report; use knit button or render() to knit
- Preview Output in IDE window
- Publish (optional) to web server
- Execute build log: If R Markdown console
- Save output file that is saved along side .Rmd

Embed code with knitr syntax

INLINE CODE
Insert with `r <code>`. Results appear as text without code.
Built with `r(knitr)` Built with 3.3.3

IMPORTANT CHUNK OPTIONS

`cache` - cache results for future knits (default = FALSE)
`cache.path` - directory to save cached results in (default = "cache")
`child` - file to knit and then include (default = NULL)
`child.path` - collapse all output into single block (default = FALSE)
`comment` - prefix for each line of results (default = "#")

CODE CHUNKS
One or more lines surrounded with ````{r}` and `````. Place chunk options with curly braces, after r. Insert with `knitr::knitWithCaching()` or `knitr::knitWithCaching()`.

| arg | description |
|---------------------------|--|
| <code>fig_align</code> | align: left, right, or center (default = "center") |
| <code>fig_captions</code> | display code in output document (default = TRUE) |
| <code>engine</code> | code language used in chunk (default = NULL) |
| <code>error</code> | display error messages in doc (TRUE) or stop render when errors occur (FALSE) (default = TRUE) |
| <code>eval</code> | run code in chunk (default = TRUE) |
| <code>include</code> | include chunk in doc after running (default = TRUE) |
| <code>warning</code> | display code warnings in document (default = TRUE) |

GLOBAL OPTIONS
Set with `knitr::opts_chunkSet()`, e.g.
````{r include=FALSE}`  
`knitr::opts_chunkSet( echo=TRUE )`

```

**5. 코드내장하기** knitr 구문을 사용해서 R 코드를 보고서에 내장한다.  
R이 코드를 실행하고, 보고서를 렌더링할 때 결과를 포함시킨다.

#### 인라인 코드

r 코드를 백틱(`)으로 감싼다.  
R이 인라인 코드를 실행된 결과로 대체한다.

2 더하기 2는 'r 2'  
2 더하기 2 equals 4.

R코드 양자리로 ```(r)으로 시작하고, ```으로 마무리한다.

Here's some code  
```(r)  
dimiris)
```

dimiris)

## [1] 150 5

#### 화면 출력 선택옵션

knitr 선택옵션을 사용해서 R 코드 명령어 출력 스타일을 적용한다.  
코드 상단 글초 내부에 선택옵션을 지정한다.

Here's some code  
(r eval=FALSE)  
dimiris)

Here's some code  
(r echo=FALSE)  
dimiris)

Here's some code  
(r eval=TRUE)  
dimiris)

Here's some code  
(r echo=TRUE)  
dimiris)

#### 선택옵션 기본설정 효과

eval	TRUE	코드를 평가하고 실행결과를 포함한다.
echo	TRUE	실행결과와 함께 코드를 출력한다.
warning	TRUE	경고메시지를 출력한다.
error	FALSE	오류메시지를 출력한다.
message	TRUE	메시지를 출력한다.
tidy	FALSE	깔끔한 방식으로 코드 형태를 변환한다.
results	"markup"	"markup", "asis", "hold", "hide"
cache	FALSE	결과값을 캐시해서 향후 실행시 건너뛰게 설정한다.
comment	"#"	주석문자로 출력결과에 서두를 붙인다.
fig.width	7	영어로 생성되는 그래프에 대한 폭을 인치로 지정한다.
fig.height	7	영어로 생성되는 그래프에 대한 높이를 인치로 지정한다.

보다 자세한 사용은 웹사이트를 참조: [yutu.name/knitr](#).

**6. 렌더링** 최종보고서를 생성하는데 .Rmd 파일을 사용하여 청사진을 제작한다.

두가지 방식으로 보고서를 렌더링한다.

- 1 rmarkdown::render("(<파일 경로>)") 명령어를 실행한다.

- 2 RStudio 스크립트 작성창 상단에 knit HTML 버튼을 클릭한다.

렌더링 명령을 실행시키면 R은 다음을 수행한다.

- 내장된 코드 렌더링각각 각각 실행시키고, 실행결과를 보고서에 삽입한다.
- 출력 파일형식에 맞춰 신규 보고서를 생성한다.
- 미리보기로 뷰어창에 출력파일을 연다.
- 작업디렉토리에 출력파일을 저장한다.

**7. 인터랙티브 문서** 작성한 보고서를 3단계를 거쳐 인터랙티브 Shiny 문서변환.

- 1 YAML 헤더에 runtime: shiny 을 추가한다.

```

title: "Line graph"
output: html_document
runtime: shiny
```

- 2 코드 렌더리에, 위젯을 내장하는 Shiny input 함수를 추가한다. Shiny render 함수를 추가해서 반응형 출력 결과를 내장한다.

```
title: "Line graph"
output: html_document
runtime: shiny

Chose a time series:
```{r echo = FALSE}  
shiny::selectInput("series", "",  
c("c100d", "l10d"))  
```  
See a plot:
```{r echo = FALSE}  
shiny::renderPlot({  
  d <- getInputsData()  
  plot(d)  
})  
```
```

- 3 rmarkdown::run 명령어로 렌더링하거나 RStudio Run Document 버튼을 클릭한다.

## Templates (Ref-rmdTemplates/M8X)

- M81-pdf: 2 columns, line numbering, page numbering
- M82-beamer: Singapore theme, line numbering, page numbering
- M83-slidy
- 주의: 하위폴더(rmd-pdf-template\_files, myRmdBeamerStyle)까지 데리고 다녀야 됨

## Discussion - rmarkdown

- Markdown이라는 Markup Language로 변환하여 사용성 높음
- 변환 과정

1. Rmd -> md -> docx, html
2. Rmd -> md -> tex -> pdf

- 약간의 수정으로 여러가지 형식의 문서를 만들 수 있음
- 자연스럽게 문법에 맞는 Color Coding
- R output에 가장 비슷한 quality의 output을 얻을 수 있음.
- 분석 -> 정리의 반복적인 작업을 하나로 줄여줌.

## Discussion - Literature Programming

- Features

1. 프로그래밍이 아닌 글쓰기가 초점
2. 데이터 분석 업무에 연관성이 높음!
3. 글을 쓴다는 것과 프로그래밍을 하는 것은 자기 자신을 표현하는 가장 높은 수준의 지적인 활동
4. 이것을 한꺼번에 할 수 있게 해주는 도구
5. !Express Yourself

- Advantages

1. 코드와 문서가 하나의 파일이라서 관리가 편함
2. 코드에서 주석을 조금만 달아도 됨
3. 코드만 있는 것에 비해서 의사소통이 용이함
4. 데이터나 분석의 결과가 달라지는 것이 문서에 즉각적으로 반영됨
5. 반복적으로 작성하는 문서 작업과 엑셀 작업을 안해도 됨
6. Colin Powell: “You don’t know what you will can get away with until you try”

## pdf 파일 제작을 위한 tex 엔진 설치

### 1. Texlive 2017 설치 (수백메가)

- <http://www.ktug.org/xe/index.php?mid=install>

### 2. 한글 폰트 설치

- google “nanumgothic download”
- google “nanummyeongjo download”
- google “nanumgothiccoding download”

### 3. 참고: google “latex beamer에서 한글 쓰기!”

## 다른 programming language의 문법

```
C, C++ ↓
for(int i=1; i <=10, i=i+1) { ↓
 printf("value of i: %d\n", i); ↓
} ↓
↓
MATLAB ↓
for i=1:10 { ↓
 disp("value of i: %d", i); ↓
} ↓
↓
Python ↓
for i in range(1, 11): ↓
 print "value of i: %d" % (i) ↓
↓
R ↓
for (i in 1:10) { ↓
 print(paste("value of i:", i)) ↓
}
```

## 실습과제

1. C:/LS-DS/classProject라는 폴더를 만드세요.
2. Rstudio를 열어서 rmarkdown의 html형식에 해당하는 classProject1.Rmd파일을 만들어 위 폴더에 저장하세요.
3. Rstudio를 닫고 classProject1.Rmd를 더블클릭하여 실행하면 working directory가 자동으로 위의 폴더가 됩니다.
4. github에서 lifeCountry.csv파일을 다운받아서 위 폴더에 넣으세요.
5. 이제 분석을 위한 모든 준비가 끝났습니다.
6. Infile/Preprocessing을 해야합니다. classProject1.Rmd에서 lifeCountry.csv를 불러와서 data.frame으로 저장합니다.
7. 각 나라의 GDP와 기대수명에 대해서 산점도를 그리고 대륙에 따라서 점의 색깔이 달라지게 해보세요.
8. 자유롭게 분석을 시작해보세요.
